

006BC2744 - Day 2 (17 July 2026)

Linux Commands

- **Install Linux** - wsl --install
- **Present working directory** - pwd
- **Change the current directory to a specified path** - cd / path
- **Move up one level in the directory tree** - cd ..
- **Go directly to your home directory** - cd ~
- **Create a new directory** - mkdir folder_name
- **Create a new empty file** - touch filename

Task 13: What do you understand by HTTP and HTTPS

The main difference between HTTP and HTTPS is security. HTTP transmits data in plain text, while HTTPS encrypts it to keep data safe from hackers

Task 14: What are methods in HTTP protocols

The five HTTP methods that handle data on the web are:

GET: Retrieves data without altering the server's state.

POST: Submits new data, which typically creates a new record or triggers side effects.

PUT: Overwrites or replaces an entire resource with the new data supplied by the client.

PATCH: Applies partial modifications to a resource, updating only the specific fields.

DELETE: Permanently removes the resource from the web server

Task 15: Give few status codes in Http protocols

200 OK: The standard response for successful HTTP requests, meaning the server fulfilled the request.

201 Created: The request was successful and resulted in a new resource being created (e.g., submitting a signup form).

400 Bad Request: The server could not understand the request due to malformed syntax or invalid parameters.

401 Unauthorized: The client must authenticate itself to get the requested response.

403 Forbidden: The server understands who the client is, but refuses to authorize the request (e.g., insufficient permissions).

404 Not Found: The requested resource or web page could not be found on the server

500 Internal Server Error: A generic error indicating the server encountered an unexpected condition that prevented it from fulfilling the request.

Task 16: What do you understand by Headers in Http

Request Headers: Sent by the client to provide context about what it needs and its identity.

Response Headers: Sent by the server to provide details about itself or the returned data.

Representation/Payload Headers: Describe the specific format, length, or encoding of the data in the message body.
